Overview

- Introduction to Google Volley
- Motivating examples
- An introduction to the reddit API
- Live coding a news reading app
- Questions

Request + Request Queue

- Network requests are encapsulated in Volley requests
- Each request is added to a RequestQueue
- Requests executed asynchronously
- Result of request returned to UI thread
- Set request priorities
- Powerful request management

Used by Google

A motivating
example

Simple network request

1. Queries reddit
 2. Grabs the text returned
 3. Creates a JSON Object
 4. Parses the JSON
 5. Updates the UI
- Lots of extra bulk
 - All requests execute in serial (default)

```
private class GenericParser extends AsyncTask<Void, Void, String[]>{

    @Override
    protected String[] doInBackground(Void... params) {

        String[] titles = null;

        try{
            // Establish a connection
            URL url = new URL("http://www.reddit.com/.json");
            HttpURLConnection connection = (HttpURLConnection) url.openConnection();

            // Grab the json
            BufferedReader reader = new BufferedReader(new InputStreamReader(
                connection.getInputStream(), "UTF-8"));
            String rawJson = reader.readLine();

            // Tidy up after yourself
            reader.close();
            connection.getInputStream().close();
            connection.disconnect();

            // Create the json object
            JSONObject jsonObj = new JSONObject(rawJson);

            // Parse json

        }catch(MalformedURLException e){
            // Catch
        }catch(IOException e){
            // Catch
        }catch(JSONException e){
            // Catch
        }

        return titles;
    }

    @Override
    protected void onPostExecute(String[] result) {
        // Use the results to populate the UI
    }
}
```

Volley request

1. Create request
2. Parse and update UI

```
new JsonObjectRequest("http://www.reddit.com/.json", null, new  
Listener<JSONObject>() {  
  
    @Override  
    public void onResponse(JSONObject jsonObj) {  
        // parse json and update UI  
    }  
  
}, null);
```

Under the hood

For a detailed description of how Volley works see:

Volley: Easy, Fast Networking for Android

YouTube: <http://goo.gl/8rk2jb>

Slides: <http://goo.gl/ZbDe8w>

reddit api

- Most pages available in JSON format by simply appending .json to the URL
 - e.g. <http://reddit.com/.json>
 - e.g. <http://reddit.com/android.json>
 - e.g. <http://www.reddit.com/comments/1m0mul.json>
- Full api available at:
 - <http://www.reddit.com/dev/api>

Live Code

- Aim is to introduce Volley
- Create a simple reddit app
 - Setup up a Volley Request Queue
 - Create a few simple requests
 - Format and display the results
 - Make the app look good

Questions?
